

PURINA® PRO PLAN® SYMPOSIUM 2025

Integrative Approach to Gastrointestinal Health

Unblocking Fat Digestion: A Comprehensive Approach to Manage Acute and Chronic Gastrointestinal Diseases in Dogs and Cats

Dr. Cecilia Villaverde, BVSc, PhD, Diplomate ACVIM (Nutrition), Diplomate ECVCN

Dr. Christina Germain, PhD, Principal Nutritionist Nestle Purina Petcare

Outline

- 1.Fat: definition, roles, uptake
- 2.Low fat diets
 - 1.Role of low fat diets on gastrointestinal diseases
 - 2.Nutritional considerations for formulating a low fat diet
- 3.MCT in GI disease
- 4.Omega 3 fatty acids in GI disease
- 5.Take home messages

Outline

1.Fat: definition, roles, uptake

2.Low fat diets

1.Role of low fat diets on gastrointestinal diseases2.Nutritional considerations for formulating a low fat diet

3.MCT in GI disease4.Omega 3 fatty acids in GI disease5.Take home messages

Dietary fat is an over-arching term used to describe the different types of fat that can be found in a pet food.

Triglyceride = Triacylglycerol

Dietary Fat

 $\mathbf{P}\mathbf{F}$

 Dietary fat is an over-arching term used to describe the different types of fat that can be found in a pet food.

Names for Fatty Acids

Names for Fatty Acids

Names for Fatty Acids

Functions of Dietary Fat in Animals

- > Aid in absorption of fat soluble vitamins
- > Source of energy
- > Cellular membrane integrity and flexibility
- > Inflammation regulation
- > Vision
- > Neural communication
- > Skin

Contributes to metabolic water

- > Provide essential fatty acids
- > Aid in absorption of fat-soluble vitamins
- Energy
- Taste

Short-Chain Fatty Acids (SCFA)

- $> \leq 6$ Carbons in length
- > Role for gut health and cell energy
- > Not typically included in diets
 - > Produced by gut microflora
- > Volatile

)(

Outline

1.Fat: definition, roles, uptake

2.Low fat diets

 Role of low fat diets on gastrointestinal diseases
 Nutritional considerations for formulating a low fat diet

3.MCT in GI disease4.Omega 3 fatty acids in GI disease5.Take home messages

Amount of fat

- Delays gastric emptying
- <u>Complex</u> to digest
- Others?

Pancreatitis

PURINA"

- Pancreatitis- premature zymogen activation
- Etiopathogenesis not 100% known
- Associations/risk factors:
 - Dog: Breed Medications Trauma Ischemia Obesity Hyperlipidemia High fat diets/treats

Cat:

Idiopathic

•Trauma

•FIP

•Hyperlipidemia

Intestinal & liver disease (triaditis)

• Hyperlipidaemia

- 18-26% dogs with acute pancreatitis can show elevations in TAG and/or cholesterol Journal of Veterinary Internal Medicine **STANDARD ARTICLE**
- Cause or consequence?
 - Toxic FA/microthrombi/calcium soaps
- High fat diets trigger or worsen
 - SUL 81 g/1000 kcal (30% DM) (NRC 2006)
 - Old data!
 - No regulatory or industry maxima
- Fatty scraps?

PURINA

Serum triglyceride and cholesterol concentrations and lipoprotein profiles in dogs with naturally occurring pancreatitis and healthy control dogs

Panagiotis G. Xenoulis^{1,2} | Paul J. Cammarata³ | Rosemary L. Walzem⁴ | Jan S. Suchodolski¹ | Jörg M. Steiner¹

Associations between dietary factors and pancreatitis in dogs

Kristina Y. Lem, DVM, MS; Geoffrey T. Fosgate, DVM, PhD, DACVPM; Bo Norby, C Med Vet, MPVM, PhD; Jörg M. Steiner, med vet, Dr med vet, PhD, DACVIM

- Looked at:
 - Table scraps (routine & week before admission)
 - Unusual food items (week before admission),
 - garbage access (week before admission)
 - part of a large gathering with food (week before admission)
 - Did NOT look into specific diets and their fat content
- Dogs with 1 or + esp. getting into the trash more likely to have pancreatitis (+ factors \rightarrow + likely).
- Authors hypothesize trash and scraps might be high fat and increase risk.

Nutritional support pancreatitis

- Supportive role. Goals:
 - Provide nutrients for body function and recovery in an easily available manner
 - > Provide energy to maintain stable body weight, ideal BCS
 - > Minimize pancreatic stimulation low fat?

Nutritional support pancreatitis

- > Lots of unknowns! best practice?
 - > Clinician dependent
 - > Cats??
 - Some controversies include:
 Do patients need fat restriction? Dogs vs cats
 What does "low fat" mean – no regulatory guidance

COMMISSION REGULATION (EU) 2020/354

of 4 March 2020

establishing a list of intended uses of feed intended for particular nutritional purposes and repealing Directive 2008/38/EC

Diet choice: dogs

Lack of data

PURINA

- Complete and balanced diet, highly digestible ("intestinal")
- Consensus that in dogs with AP low fat can help
 - > No consensus on what Low Fat means
- Intestinal Low Fat diets (16-22% calories) → can be used w/o sacrificing calories

AND Critical Care

Retrospective Study

Statistical trend: low fat fed patients: fewer intolerance episodes

Retrospective evaluation of the impact of early enteral nutrition on clinical outcomes in dogs with pancreatitis: 34 cases (2010–2013)

Jessica P. Harris, DVM; Nolie K. Parnell, DVM, DACVIM; Emily H. Griffith, PhD and Korinn E. Saker, MS, DVM, PhD, DACVN

Journal of Veterinary Emergency and Critical Care 00(0) 2017, pp 1-9

doi: 10.1111/vec.12612

What about long term?

Return to original diet?

- Fat level
- > Trigger identified?
- > Obese dogs: weight loss plan!
-) Hyperlipidemia

>For chronic/recurrent cases

- Consider long term use diet lower in fat than the diet at diagnostics (50% decrease)
- > Low fat treats!

What about cats

- Chronic dz + common
- > No evidence fat moderation helps

- Complete and balanced for the lifestage, highly digestible
- Consider co-morbidities (e.g. hydrolysed diets in triaditis)
- Can try to moderate fat (vs current diet) if refractory or lipemia

53 g/1000 kcal (45% ME)

Journal of Veterinary Emergency and Critical Care **19**(4) 2009, pp 337–346 doi: 10.1111/j.1476-4431.2009.00438.x

Nasogastric tube feeding in cats with suspected acute pancreatitis: 55 cases (2001–2006)

> Endoscopic biopsies: lymphangiectasia

<u>Management</u>: Primary cause (if any) Supportive (e.g. clopidogrel...) Diet

✓ Highly digestible

- Elimination diet if secondary to food responsive chronic enteropathy
- Main: Fat restriction (decrease
 lymphatic flow and lacteal pressure)

Nutritional Assessment Checklist

To be completed by the pet owner. Please answer the following questions about your pet:

Pet's name: Buster	Species/breed: YS	Г	Age:	9 y 🔨 🐪
Owner's name: M&X	Date form completed:		-	-
1 How active is your pet?	Very active 🗌	Moderately active 🗌		Not very active 😡
2 How would you describe your pet's weight?	Overweight 🗌	ideal weight 🕮		Underweight 🗌
3 Where does your pet spend most of the time		Outdoor 🗌		Indoor & Outdoor 🗌

Please list below the brands and product names (if applicable) and amounts of ALL foods, treats, snacks, dental hygiene products, rawhides and any other foods that your pet is currently eating, including foods used to administer medications:

Food	Form		*Amount	1	lumber	Fed since
Examples:						
 Purina Cat Chow 	dry		½ cup		2x/day	Jan 2010
 90% lean hamburger 	pan-fried		3 oz (85 grams)		1x/week	May 2011
 Milk Bone medium 	dry		2		3/day	Aug 2012
 Greenies Salmon Dental 	treat		2		daily	Jan 2013
Maintenance	díet Dry		ad líb		daíly	
Table scraps		?		daíly		
Chicken jerky		1~2		daíly		

*If you feed by volume, what size measuring device do you use?

*If you feed tinned/canned food, what size tins/cans? ______

O you give any dietary supplements to your pet (for example: vitamins, glucosamine, fatty acids, or any other supplements)? No 2 Yes

If yes, please list brands and amounts:_

- > Current diet: 34 g fat/1000 kcal (29% fat calories)
 - > Not counting table foods or other treats
- Feeding plan:
- Diet choice: Commercial "low fat" (19 g/1000 kcal, 16% fat calories) 44% reduction
- Allowance energy needs estimated as 322 kcal/day
 Diet: 3.7 kcal/g → 322/3.7 = 87 grams/day
 Schedule: 29 g x 3

- > Partial improvement
- Needs more fat restriction? Limited novel ingredients?
- Homemade diet:
 - > Egg whites
 - > White rice
 -) Corn oil (ω6)
 - > No omega 3 source
 - > Supplements

PURINA®

<u>10% fat calories (11 g/1000 kcal)</u> Still meeting EFA requirements

Albumin (g/dL)

When choosing a low fat diet:

- Do a diet history to assess current fat intake – complete
- Fat intake should be assessed on a calorie basis! – do not trust claims

Example

PURINA

Intestinal low fat dry diet (7% as fed)

Caregiver fins commercial raw diet with 7% fat and considered equivalent (plus more "natural")

Product guides of vet diets usually provide information on calorie basis

50 g/1000 kcal (42% calories)

Nutritional Considerations & Challenges Creating Low Fat Diets

- > Essential fatty acids
- > Effect on digestibility
- > Many ingredients contain fat
 - > Limitations on ingredients allowed in pet food
- Palatability

Outline

- 1.Fat: definition, roles, uptake
- 2.Low fat diets
 - 1.Role of low fat diets on gastrointestinal diseases2.Nutritional considerations for formulating a low fat diet

3.MCT in GI disease

4.Omega 3 fatty acids in Gl disease 5.Take home messages

Medium-Chain Triglycerides (MCT) Definition

- > A triglyceride composed of medium-length fatty acids
- > 6-12 Carbons in Length
 - > 6 Carbon fatty acids have some properties of both short- and medium-length fatty acids
 - > 12 Carbon fatty acids have some properties of both medium- and long-length fatty acids
- Only saturated form (no double bonds)

......

PRO PLAN

MCTs – What Can They Do?

- > Additional/Alternative energy source
 - > Including for the gastrointestinal cells
- > Easily absorbed source of fat, high in energy
- > Increase daily activity

MCT in GI disease

- Specific interest in fat malabsorption syndromes (intestinal lymphangiectasia, EPI)
- Careful! Do not provide EFA

Effects of exchange of dietary medium chain triglycerides for long-chain triglycerides on serum biochemical variables and subjectively assessed well-being of dogs with exocrine pancreatic insufficiency

Gabriele M. Rutz, Dr med vet; Jörg M. Steiner, Dr med vet, PhD; John E. Bauer, DVM, PhD; David A. Williams, VetMB, PhD

Impact of fatty acid composition on markers of exocrine pancreatic stimulation in dogs

Yunyi Zhang¹, Claudia A. Kirk¹, M. Katherine Tolbert², Jörg M. Steiner², Dallas Donohoe³, Maryanne Murphy¹, Cary Springer⁴, Angela Witzel-Rollins¹*

Article

Fecal Microbiota, Bile Acids, Sterols, and Fatty Acids in Dogs with Chronic Enteropathy Fed a Home-Cooked Diet Supplemented with Coconut Oil

Outline

- 1.Fat: definition, roles, uptake
- 2.Low fat diets
 - Role of low fat diets on gastrointestinal diseases
 Nutritional considerations for formulating a low fat diet
- 3.MCT in GI disease
- 4. Omega 3 fatty acids in GI disease
- 5. Take home messages

Omega-3 Fatty Acids Definitions

> Conditionally essential fatty acids

PURINA

> All are long-chain fatty acids with minimum of 3 double bonds.

ALA, EPA, DHA are most known for dietary purposes

Omega-3 Fatty Acids – What Can They Do?

- > Vision
- > Neural communication (myelin sheaths)
- > Important for managing cell permeability (including gut cells)
- > Regulate inflammatory environment in the body

Omega 3 fatty acids in GI disease

- Proposed beneficial in chronic inflammatory enteropathies due to modulation of inflammation
- > Lack of prospective clinical data safe, potentially helpful
 - > Canine dose extrapolated from cAD studies: 125 mg EPA+DHA/kg^{0.75}
 - > Cats?
- > Diet vs supplementation

Take home messages

- Fat plays an important role in the diet (essential fatty acid provision, energy density, texture, palatability) and in the body (energy source, cell membrane structure, hormones, secondary messengers...)
- Fat modification (in type and amount) is an important dietary strategy in several gastrointestinal diseases, especially in dogs
- Fat sensitive GI conditions include pancreatitis, some types of PLE and CIE
- Commercial intestinal low fat diets, despite challenges in formulation, are overall palatable, with acceptable energy density and can be used in these cases
 - > Ultra low fat homemade diets can be formulated when these are not sufficient
